## Diet Effect on Mice Lifetimes

(STAT587@ISU) R07 - Contrasts August 28, 2024

## ANOVA and Regression Models

ANOVA model:

$$Y_{ij} \stackrel{ind}{\sim} N(\mu_j, \sigma^2)$$

with  $Y_{ij}$  being the lifetime for the *i*th mouse on the *j*th diet for j = 0, 1, 2, 3, 4, 5.

Regression model:

$$Y_i \stackrel{ind}{\sim} N(\beta_0 + \beta_1 X_{i,1} + \ldots + \beta_p X_{i,p}, \sigma^2)$$

where  $Y_i$  is the lifetime for the *i*th mouse and  $X_{i,j}$  is an indicator for the *i*th mouse being on the *j*th diet.

Reparameterized model since

$$\mu_0 = \beta_0 \quad \text{and} \quad \mu_j = \beta_0 + \beta_j$$

for j > 0.

## Scientific questions

Here are a few example scientific questions:

- 1. What is the effect of pre-wean calorie restriction on mean lifetimes?
- 2. What is the difference in mean lifetimes between mice on a 40 kcal diet compared to those on a 50 kcal diet?
- 3. What is the effect of high calorie vs low calorie diets on mean lifetimes?

#### We can compute contrasts:

$$\gamma_{1} = \mu_{R/R50} - \mu_{N/R50}$$

$$\gamma_{2} = \mu_{N/R40} - \frac{1}{2}(\mu_{N/R50} + \mu_{R/R50})$$

$$\gamma_{3} = \frac{1}{4}(\mu_{N/R50} + \mu_{R/R50} + \mu_{N/R40} + \mu_{lopro}) - \frac{1}{2}(\mu_{NP} + \mu_{N/N85})$$

#### Contrasts

A linear combination of group means has the form

$$\gamma = C_1 \mu_1 + C_2 \mu_2 + \ldots + C_J \mu_J$$

where  $C_j$  are known coefficients and  $\mu_j$  are the unknown population means.

A linear combination with  $C_1 + C_2 + \cdots + C_J = 0$  is a contrast.

Contrast interpretation is usually best if  $|C_1|+|C_2|+\cdots+|C_J|=2$ , i.e. the positive coefficients sum to 1 and the negative coefficients sum to -1.

#### Inference on Contrasts

Contrast

$$\gamma = C_1 \mu_1 + C_2 \mu_2 + \dots + C_J \mu_J$$
 with  $\hat{\gamma} = C_1 \overline{Y}_1 + C_2 \overline{Y}_2 + \dots + C_J \overline{Y}_J$ 

with standard error

$$SE(\hat{\gamma}) = \hat{\sigma}\sqrt{\frac{C_1^2}{n_1} + \frac{C_2^2}{n_2} + \dots + \frac{C_J^2}{n_J}}.$$

p-values for  $H_0: \gamma = g_0$  vs  $H_A: \gamma \neq g_0$  and posterior probabilities (i.e.  $2P(\gamma > 0|y)$  or  $2P(\gamma < 0|y)$ ):

$$t = \frac{g - g_0}{SE(g)}, \quad p = 2P(T_{n-J} < -|t|).$$

Two-sided equal-tail  $100(1-\alpha)\%$  confidence/credible intervals:

$$g \pm t_{n-J,1-\alpha/2} SE(g)$$
.

### Contrasts for mice lifetime dataset

#### For these contrasts:

- 1. Mean lifetimes for N/R50 and R/R50 diet are different.
- 2. Mean lifetimes for N/R40 is different than for N/R50 and R/R50 combined.
- 3. Mean lifetimes for high calorie (NP and N/N85) diets is different than for low calorie diets combined.

$$H_0: \gamma = 0 \qquad H_A: \gamma \neq 0:$$

(STAT587@ISU)

$$\begin{array}{ll} \gamma_{1} = & \mu_{R/R50} - \mu_{N/R50} \\ \gamma_{2} = & \mu_{N/R40} - \frac{1}{2}(\mu_{N/R50} + \mu_{R/R50}) \\ \gamma_{3} = & \frac{1}{4}(\mu_{N/R50} + \mu_{R/R50} + \mu_{N/R40} + \mu_{lopro}) \\ & - \frac{1}{2}(\mu_{NP} + \mu_{N/N85}) \end{array}$$

## Summary

- Contrasts are linear combinations of means where the coefficients sum to zero
- t-test tools are used to calculate pvalues and confidence intervals

## Sulfur effect on scab disease in potatoes

The experiment was conducted to investigate the effect of sulfur on controlling scab disease in potatoes. There were seven treatments: control, plus spring and fall application of 300, 600, 1200 lbs/acre of sulfur. The response variable was percentage of the potato surface area covered with scab averaged over 100 random selected potatoes. A completely randomized design was used with 8 replications of the control and 4 replications of the other treatments.

Cochran and Cox. (1957) Experimental Design (2nd ed). pg96 and Agron. J. 80:712-718 (1988)

#### Scientific questions:

- Does sulfur have any impact at all?
- What is the difference between spring and fall application of sulfur?
- What is the effect of increased sulfur application?

### Model

 $Y_{ij}$ : avg % of surface area covered with scab for plot i in treatment j for  $j=1,\ldots,7$ .

Assume  $Y_{ij} \stackrel{ind}{\sim} N(\mu_j, \sigma^2)$ .

#### Hypotheses:

- Difference amongst any means: One-way ANOVA F-test
- Any effect:
- Contrast: control vs sulfur
- Fall vs spring:
   Contrast: fall vs spring applications
- Sulfur level:
   Contrast: linear trend

#### Contrasts

• Sulfur effect: Any sulfur vs none

$$\gamma = \frac{1}{6}(\mu_{F12} + \mu_{F6} + \mu_{F3} + \mu_{S3} + \mu_{S6} + \mu_{S12}) - \mu_O$$
$$= \frac{1}{6}(\mu_{F12} + \mu_{F6} + \mu_{F3} + \mu_{S3} + \mu_{S6} + \mu_{S12} - 6\mu_O)$$

Fall vs spring: Contrast comparing fall vs spring applications

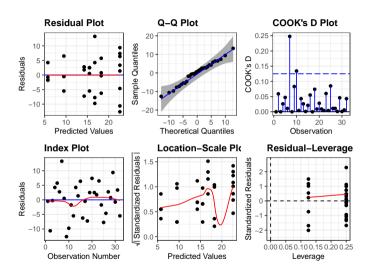

$$\gamma = \frac{1}{3}(\mu_{F12} + \mu_{F6} + \mu_{F3}) + 0\mu_O - \frac{1}{3}(\mu_{S3} + \mu_{S6} + \mu_{S12})$$
$$= \frac{1}{3}[1\mu_{F12} + 1\mu_{F6} + 1\mu_{F3} + 0\mu_O - 1\mu_{S3} - 1\mu_{S6} - 1\mu_{S12}]$$

## Contrasts (cont.)

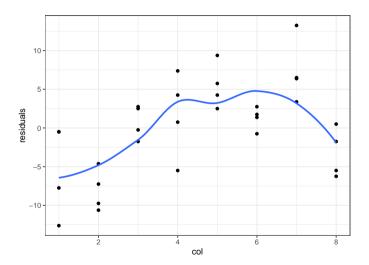

- Sulfur linear trend
  - The group sulfur levels  $(X_j)$  are 12, 6, 3, 0, 3, 6, and 12 (100 lbs/acre)
  - and a linear trend contrast is  $X_j \overline{X}$

$$\gamma = 6\mu_{F12} + 0\mu_{F6} - 3\mu_{F3} - 6\mu_O - 3\mu_{S3} + 0\mu_{S6} + 6\mu_{S12}$$

Trt	F12	F6	F3	0	S3	S6	S12	Div

## Summary

#### For this particular data analysis

- Significant differences in means between the groups (ANOVA  $F_{6,25}=3.61$  p=0.01)
- ullet Having sulfur was associated with a reduction in scab % of 9 (4,15) compared to no sulfur
- Fall application reduced scab % by 6 (0.5,12) compared to spring application
- Linear trend in sulfur was significant (p=0.01)

- Concerned about spatial correlation among columns
- Consider a logarithm of the response
  - CI for F12 (-1.2, 12.7)
  - Non-constant variance (residuals vs predicted, sulfur, application)
